Navarre Minerals (ASX: NML) is a Victoria-based explorer with four main exploration projects in central and western Victoria with potential for large gold and copper-gold-zinc deposits.

## Navarre Minerals' targets copper-gold at Eclipse porphyry prospect in Victoria

Tuesday, January 28, 2014 by John Phillips

The importance of the Miga Arc region is that its geology is like the Andes, which is host to the world's largest known copper porphyry systems.

**Navarre Minerals** (ASX: NML) is targeting a supergene blanket of secondary copper (chalcocite) mineralisation in a new reverse circulation drilling program at the Eclipse copper-gold porphyry prospect, in the Miga Arc region of western Victoria.

The importance of the Miga Arc region is that its geology is like the Andes, which is host to the world's largest known copper porphyry systems.

Navarre holds 100% ownership of big footprint in the area, and has 'first mover' position.

Drilling will cover 10 to 15 holes for 1000 metres.

The mineralisation is over widespread copper, gold and zinc mineralisation interpreted to be associated with a potential porphyry deposit detected at Eclipse during 2013.

The geology is recognised as an Andean-style volcanic arc concealed below recent thin cover and remains under-explored.

Rocks are similar in age and type to Mt Read Volcanics of Tasmania, host to Mt Lyell and Rosebery Mines.

Importantly for the company, its projects are near established infrastructure, including power, port, rail, highways, workforce and a processing facility.

Navarre is capitalised at \$5 million, and therefore is potentially placed for a positive re-rating on any drilling success.
